

# KARMA PEAT-FREE 9CM ANTHURIUMS

Peat is applied to provide the plants with more moisture retention and preservation of vitamins in the potting soil. This is obtained from peat areas, but it starts with cutting down trees and forests. Peatlands are formed there. This can lead to soil subsidence in the peat areas, causing flooding, but the risk of fire is also higher. It is a slow process but has many consequences for the climate because carbon is released into the air.

## Groundbreaking first steps ...

Karma Plants has taken the plunge and the 9cm pot Anthuriums have been grown completely peat-free. Thanks to the innovative 'Grown with Waterwick' Cultivation System, it is possible to take this groundbreaking step. The findings of all tests are very positive and see a significant improvement in root formation which is making the plants even stronger.

**The peat in the potting soil is unnecessary because the moisture is absorbed by the "Grown with Waterwick" cultivation system which every plant of Karma Plants is supplied with.**
